

Injections can be used to fill cavities and pores in the sub-soil.

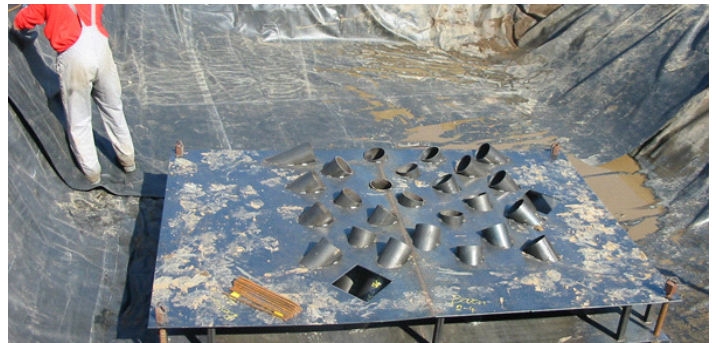

Execution

Various methods can be used, depending on the kind of soil to be treated. Cement mortar is commonly used and injections can be performed from top or bottom, depending on the situation or even locally if needed. Hidden cavities underneath floors can be filled to improve the strength of the floor.

Applications

Stabilisation of road surfaces or concrete floors. Increase of load bearing capacity of the structure.

Advantages

- Compact equipment can be used to allow injection to be performed inside buildings and cellars.
- Increase of soil cohesion.
- Reduction of water permeability of the soil.
